Oracle Single Instance Dataguard Implementation using Ansible PowerODBA

1. Introduction

This document provides a comprehensive guide on automating the Data Guard setup of Oracle Single Instance database running on IBM Power AIX operating system, supports both JFS and Oracle ASM. This has been tested with 19.25 & 19.26 oracle version. Also tested playbook using Ansible Automation Platform 2, it includes the architecture, prerequisites, limitations, playbook details, variables explanation and execution steps. Using Ansible, this solution streamlines the physical standby creation.

2. Versions

PODBA v2.0.7

- Introduced Dataguard feature for single instance database using RMAN Backup and RMAN DUPLICATE method

3. Architecture Diagram

Diagram representation of the primary and standby database setup with Data Guard, Ansible control node, and network communication.

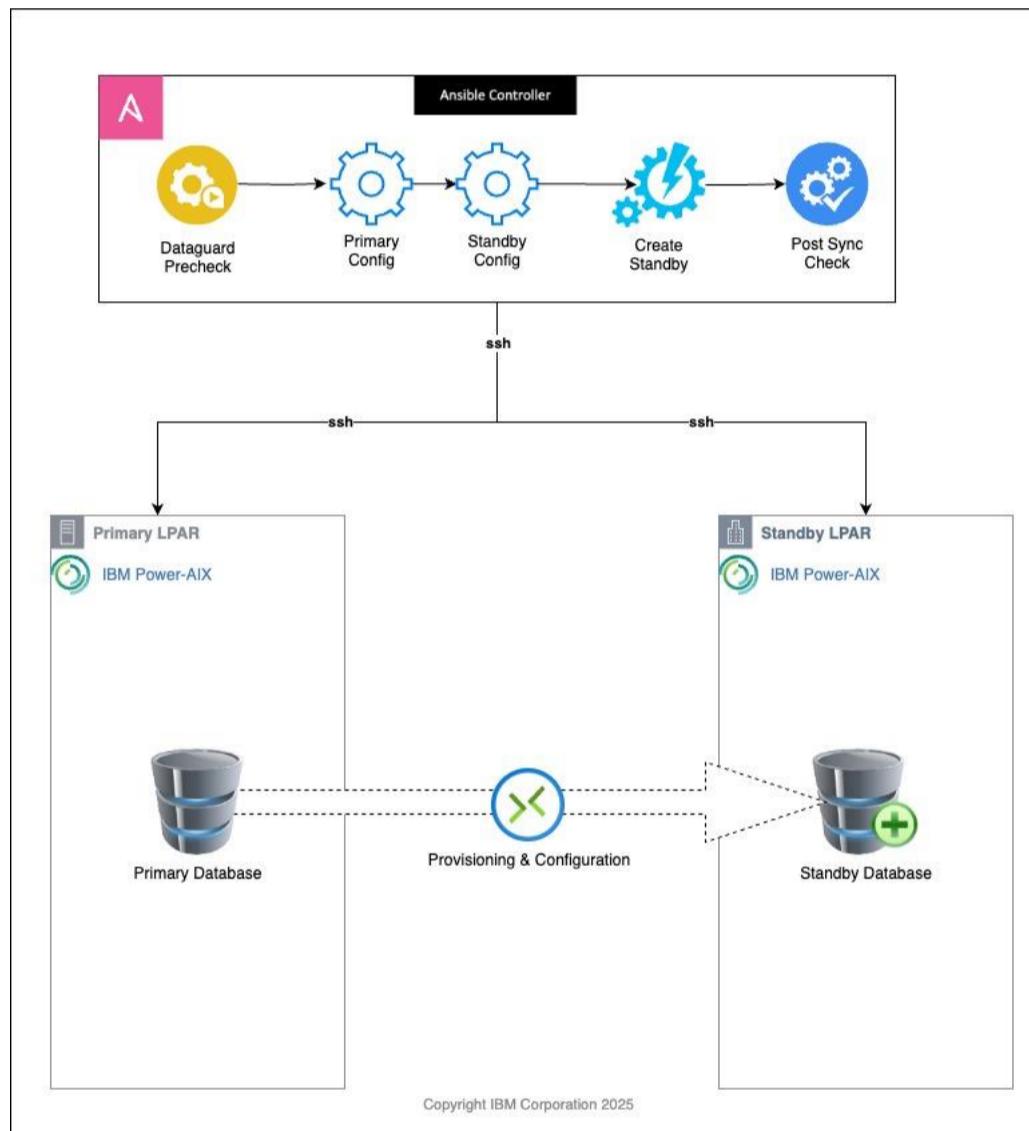

Fig: 1 Oracle Single Instance Dataguard Implementation using Ansible PowerODBA Collection

4. Prerequisites

This playbook assumes the following:

- Oracle 19c Software installed on both nodes primary and standby , please visit https://galaxy.ansible.com/ui/repo/published/ibm/power_aix_oracle/ for installing Oracle Single Instance database 19c on new AIX operating system and create test database on AIX filesystem JFS2 or Oracle ASM.
- Ansible installed on the control node
- Passwordless SSH setup between control node and both managed hosts AIX database servers
- Requires network connectivity between the primary and standby databases servers , hostnames provided in variable file should be pingable from each other
- Ensure sufficient storage, memory and CPU resources are available on both sites primary and standby servers
- ASM disk groups or JFS file systems needed for standby database should be configured
- Primary database should be in ARCHIVE_LOG mode
- REDO log sizes should be identical for primary database
- Patch levels between primary and standby for Oracle Clusterware and database should be same , to ignore please use ignore_precheck = true
- On the standby server with ASM, set up passwordless SSH (SSH equivalence) from the Oracle user to the Grid user in case of role separation - different user for grid stack and oracle DB home stack
ssh grid_user@standby_hostname should be enabled from oracle_user in standby server
- Update the backup_location in vars if different in both primary and standby before invoking the respective play
- Make sure oracle database software owner has appropriate permission to \$ORACLE_BASE/admin directory on standby standby server.
Preferably :
chmod -R 775 \$ORACLE_BASE/admin
chown -R <oracle_user>:<oracle_user_group> \$ORACLE_BASE/admin

To get started with Ansible refer

https://docs.ansible.com/ansible/latest/user_guide/intro_getting_started.html

To get started with Oracle Database on AIX refer

<https://docs.oracle.com/en/database/oracle/oracle-database/19/axdbi/index.html>

To get started with AIX refer

https://www.ibm.com/support/knowledgecenter/ssw_aix_72/navigation/welcome.html

5. Ansible Playbook Setup and Execution Steps

Below section provides the detail steps that are need to be followed for running the playbook.

5.1 Install Ansible Controller on your preferred operation system.

We have installed and tested Ansible Controller on x86 server and Linux-on-Power server

Refer : https://docs.ansible.com/ansible/latest/installation_guide/intro_installation.html

We have created a user “ansible” on LoP server and considered /home/ansible as working directory.

5.2 Setup ssh Equivalence between the Ansible controller and managed host (Primary and Standby) server

If this is a first time using ssh, then you probably haven’t created your ssh keys. To check go to `~/.ssh` and see if `id_rsa` file exists. If not you must create the ssh keys.

To create the ssh keys, run the following:

➤ `ssh-keygen`

Next copy the keys to the managed host.

➤ `ssh-copy-id root@<managed_host>`

Eg: `ssh-copy-id root@aixhost`

Check/Verify ssh connectivity

➤ `ssh root@aixhost`

5.3 Download playbook from Galaxy

Download the Oracle Dataguard ansible collection from ansible galaxy or github.

https://galaxy.ansible.com/ui/repo/published/ibm/power_aix_oracle_dba/

Download the `power_aix_oracle_dba` tarball from ansible-galaxy and extract it to some directory for offline use or you can run the ansible-galaxy installation command:

`ansible-galaxy collection install ibm.power_aix_oracle_dba`

The above command will install `power_aix_oracle_dba` collection at location `~/.ansible/collections`
For more information regarding ansible collections refer below link

https://docs.ansible.com/ansible/latest/user_guide/collections_using.html

6. Ansible Playbook Description

6.1 Playbook Files

1. **Path to the collection:** `$ansible-collection-install-dir/ibm/ansible-power-aix-oracle-dba`.
2. **dataguard_rman_backup_playbook.yml:** This is the *playbook* file which is responsible for taking RMAN backup of primary database. The file is under - “`ansible-collection-install-dir`”/`ibm/ansible-power-aix-oracle-dba/playbooks`.
3. **dataguard_playbook.yml:** This is the *playbook* file which is responsible for provisioning and configuring oracle physical standby database based on primary database config by calling the respective roles. The file is under - “`ansible-collection-install-dir`”/`ibm/ansible-power-aix-oracle-dba/playbooks`.
4. **inventory.yml:** This file is provided in the collection which contain all the managed hosts (Primary and Standby) details. It is NOT mandatory to use only this file, if you already have an inventory file defined in another location, that can be used also.
5. **dataguard_vars.yml:** This file contains all the variables required to take RMAN backup and create the standby database. It is under - “`ansible-collection-install-dir`”/`ibm/ansible-power-aix-oracle-dba/playbooks/vars/dataguard`. Specification of each variable is provided in this file itself.
6. **vault.yml:** The sys user password of primary database must be mentioned in this file, this file is in “`ansible-collection`-

installdir/ibm/ansible-power-aix-oracle-dba/playbooks/vars. It must be encrypted using “ansible-vault” after the password is stored in the file. Ansible Vault is a security utility provided by Ansible to encrypt files which contain sensitive information such as passwords. Refer: [A brief introduction to Ansible Vault | Enable Sysadmin \(redhat.com\)](#)

```
$ ansible-vault encrypt vault.yml
```

6.2 Ansible Playbook Structure

The Dataguard setup playbook is organized into five roles for ease of maintenance and reusability:

1. **dataguard_precheck:**
 - Pre-config checks to validate current primary database configurations
 - Pre-config checks to validate current standby server
2. **dataguard_primary_config:**
 - Configure Dataguard parameters in primary database
 - Enables FORCE LOGGING
 - Creates the Standby Redo Logs
3. **dataguard_standby_config:**
 - Configure Dataguard parameters in standby database
4. **dataguard_create_standby:**
 - Creates standby using RMAN ACTIVE DUPLICATE or RMAN Backup
 - Starts the standby database in managed recovery mode
5. **Dataguard_post_sync_check:**
 - Checks Data Guard synchronization.
 - Ensures logs are applied on the standby

6.3 Ansible Playbook Roles

Detailed description of the actions performed by each Ansible role in the standby provisioning and configuring process:

dataguard_precheck	
Performs the precheck required for standby configuration	
1. Checks if Dataguard setup was already done	
2. Verifies network connectivity between primary and standby	
3. Check Grid home Oracle DB home patch set	
4. Checks the primary database is in ARCHIVELOG_MODE	
5. Checks the standby site has enough space	
6. Performs System Configuration Comparison between primary and standby and show warning	
7. Validates the input variable in dataguard_vars.yml file	
dataguard_primary_config	
Configures the primary database	
1. Checks if Dataguard setup was already done	
2. Run Dataguard Pre-config tasks for primary	
3. Enable FORCE_LOGGING if not already	
4. Enable standby file management	
5. Create standby redo logs (SRL)	
6. ADD TNS alias added for standby database tnsnames.ora	
7. Modify the primary initialization parameter for dataguard on primary	
dataguard_standby_config	
Configures the standby database	
1. Checks if Dataguard setup was already done	
2. Run Dataguard Pre-config tasks for standby	
3. ADD TNS alias added for primary database tnsnames.ora	
4. Create temporary listener for RMAN ACTIVE duplicate method only	
5. Validates successful TNS connections between both sites	
6. Set the standby initialization parameter	
7. Fetch password and PFILE file from primary	
dataguard_create_standby	
Provisioning of standby database	
1. Checks if Dataguard setup was already done	
2. Fetch DBID and control file location from primary database	
3. Run Dataguard Restore Script on standby	
4. Validate Dataguard restore Status and Run Restore Post-Processing Script on standby	
5. Run Protection Mode Post-Processing on primary to MAX_PERFORMANCE	
6. Remove temporary listener for RMAN ACTIVE duplicate method only	
dataguard_post_sync_check	
Checks Data Guard synchronization	
1. Validate Data Guard is in sync with primary or not	
2. Compare sequence numbers between primary and standby	
3. Attempt to sync by restarting redo logs shipping and restarting MRP	
4. Displays the Data Guard Sync Status	

7. Limitations

- This setup has been tested on Oracle 19c Single Instance non-multitenant database running on AIX
- If GAP between primary and standby is more then take incremental backup and sync manually
- Having identical software and hardware configurations between the primary and standby sites is desirable for optimal performance
- Update default parameter primary_cpu_core/ standby_cpu_core in defaults if more than 4 parallelism is required for RMAN backup and restore
- Force logging is enabled by default if not already set on the primary
- Assumes all disk groups or file systems are already created with appropriate permission in both primary and standby
- In this release, Data Guard operates in MAXIMUM PERFORMANCE mode only and does not support other modes
- Multiple standby database is not supported in this release
- Use nohup to avoid timeouts while execution of playbook
- These playbooks will create two directories inside ansible in /tmp. It should NOT be removed until the dataguard setup completes otherwise it will compromise idempotency.
- Try this on a non-production environment first before using it on a Production environment.

8. Methods for Configuring Standby Database

8.1 RMAN ACTIVE Duplicate

1. Automation leverages RMAN DUPLICATE TARGET DATABASE command
2. No need to take or transfer backup files manually
3. Supports both ASM and JFS file systems

8.2 RMAN Backup-Based

1. Take an RMAN backup of the primary database using ansible play (dataguard_rman_backup_playbook.yml) or manually
2. Transfer backup files to the standby server manually and update the backup_location in the variable file.
3. Restores and recovers the standby database
4. Supports both ASM and JFS file systems

8.3 Parameters for each methods

Methods	grid_asm_flag	with_backup
JFS2 RMAN Backup based	false	true
JFS2 RMAN ACTIVE Duplicate	false	false
ASM RMAN Backup	true	true
ASM RMAN ACTIVE Duplicate	true	false

9. Preparing to run the Dataguard playbook

9.1 Change directory to the galaxy_collection directory

```
$ cd ansible-power-aix-oracle-dba
```

9.2 Update the inventory

```
[primary]
primary-db ansible_host=111.11.11.111

[standby]
standby-db ansible_host=222.22.22.222
```

9.3 Update the variable file

Please update the variables by referring Sample variables for selected methods are available at vars/sample_vars directory.

9.4 Update the vaults.yml file with sys password and encrypt it with ansible vault

```
$ cat vars/vault.yml
asm_password: ##### # sys user password for Primary database
$ ansible-vault encrypt vars/vault.yml
```

10. Execute the playbook

10.1 RMAN ACTIVE DUPLICATE

No prior backup needed , this ansible play will create a physical standby database using RMAN DUPLICATE FROM ACTIVE DATABASE command without shutting down the primary and using primary active database files.

dataguard_playbook.yml:

```
# This playbook is used to configure dataguard for 19c.
# Before executing this playbook, please refer the documentation inside the docs directory.
#
# - hosts: all_nodes                                # Provide the name of the target lpar registered in ansible
inventory.
# remote_user: oracle                               # This needs to be run by "oracle" user.
# gather_facts: False
```

```

# vars_files:
#   - vars/dataguard/dataguard_vars.yml # update all the required variables
#   - vars/vault.yml      # update the passwords

- name: Configure Data Guard for 19c
  hosts: all
  remote_user: "{{ db_oracle_user }}"
  gather_facts: false
  vars_files:
    - vars/dataguard/dataguard_vars.yml
    - vars/vault.yml

  roles:
    - role: dataguard_precheck
      tags: dataguard_precheck

    - role: dataguard_primary_config
      tags: dataguard_primary_config

    - role: dataguard_standby_config
      tags: dataguard_standby_config

    - role: dataguard_create_standby
      tags: dataguard_create_standby

    - role: dataguard_post_sync_check
      tags: dataguard_post_sync_check

```

Provision and configure standby: This command will perform end to end setup of standby database.

```

ansible-playbook dataguard_play.yml -i inventory.yml --ask-vault-pass --tags
dataguard_precheck,dataguard_primary_config,
dataguard_standby_config,dataguard_create_standby,dataguard_post_sync_check
or
ansible-playbook dataguard_playbook.yml -i inventory.yml --ask-vault-pass

```

Check GAP: This command will check and attempt to sync if gap is minimal and can resolved within three minutes

```

ansible-playbook dataguard_playbook.yml -i inventory.yml --ask-vault-pass --tags
dataguard_post_sync_check

```

10.2 RMAN BACKUP BASED

Take RMAN backup of primary database using below ansible playbook and manually transfer the backup at standby site.

dataguard_rman_backup_playbook.yml:

```

# This playbook is used to secure backup to create dataguard for 19c.
# Before executing this playbook, please refer the documentation inside the docs directory.
#
# - hosts: all_nodes                                # Provide the name of the target lpar registered in
#   ansible inventory.
#   remote_user: oracle                            # This needs to be run by "oracle" user.
#   gather_facts: False
#   vars_files:
#     - vars/dataguard/dataguard_vars.yml # update all the required variables
#     - vars/vault.yml      # update the passwords

- name: Configure Data Guard for 19c
  hosts: all
  remote_user: "{{ db_oracle_user }}"
  gather_facts: false
  vars_files:
    - vars/dataguard/dataguard_vars.yml
    - vars/vault.yml

  roles:
    - role: backup_primary_db
      tags: backup_primary_db

```

RMAN backup: Initiate RMAN backup for primary. This command will perform the RMAN backup at primary database.

```

ansible-playbook dataguard_rman_backup_playbook.yml -i inventory.yml --ask-vault-pass

```

Note: Please transfer the backup to standby server.

Provision and configure standby: This command will perform end to end setup of standby database.

```

ansible-playbook dataguard_play.yml -i inventory.yml --ask-vault-pass --tags
dataguard_precheck,dataguard_primary_config,
dataguard_standby_config,dataguard_create_standby,dataguard_post_sync_check
or
ansible-playbook dataguard_playbook.yml -i inventory.yml --ask-vault-pass

```

Check GAP: This command will check and attempt to sync if gap is minimal and can resolved within three minutes

```

ansible-playbook dataguard_playbook.yml -i inventory.yml --ask-vault-pass --tags
dataguard_post_sync_check

```

Sample Execution logs: Please find the sample execution logs in - docs/ dataguard_sample_execution_logs/ directory

11. Executing Oracle collection using Ansible Automation Platform 2 (AAP2)

Ansible Automation Platform 2 is fully restructured for a hybrid cloud-native world and enables to execute automation in containerized environments.

Here in this section we will show to create the containerized image and execute the playbook using execution environment(Containerized image).

At first using “ansible-builder” build the Container Image .For more info regarding ansible-builder refer to below

https://access.redhat.com/documentation/en-us/red_hat_ansible_automation_platform/2.0-ea/html-single/ansible_builder_guide/index

To execute this playbook from AAP2 follow below steps. An example document is provided here:

11.1 Build the podman environment

```
su - awx
Create directory
mkdir oracle_si_dataguard_ee

vi execution-environment.yml
# Execution Environment
---
version: 3

images:
  base_image:
    name: registry.redhat.io/ansible-automation-platform-24/ee-minimal-rhel8:latest
options:
  package_manager_path: /usr/bin/microdnf
```

After creating execution-environment.yml file use ansible-builder to build container image run below

```
$ ansible-builder build -t oracle_si_dataguard_ee -f execution-environment.yml
Running command:
  podman build -f context/Containerfile -t oracle_si_dataguard_ee context
Complete! The build context can be found at: /var/lib/awx/oracle_si_dataguard_ee/context
```

Validate the image:

```
$ podman images
REPOSITORY                                     TAG      IMAGE ID      CREATED        SIZE
localhost/oracle_si_dataguard_ee               latest   35c6e5dae65f  47 seconds ago  362 MB
localhost/oracle_aix_ee                         latest   a7d4b0992ea4  2 months ago   475 MB
localhost/powerodba                           latest   3d1b75b3ee16  3 months ago   910 MB
registry.redhat.io/ansible-automation-platform-24/ee-supported-rhel8 latest   b2d26de2d8de  11 months ago  1.79 GB
registry.redhat.io/ansible-automation-platform-24/ee-minimal-rhel8    latest   c239714e9480  11 months ago  380 MB
quay.io/ansible/ansible-runner                 latest   bec0dc171168  2 years ago   816 MB
```

11.2 Execute Playbook via CLI - Ansible-Navigator

We can use ansible-navigator for executing the playbook in CLI using execution environments (Container image).

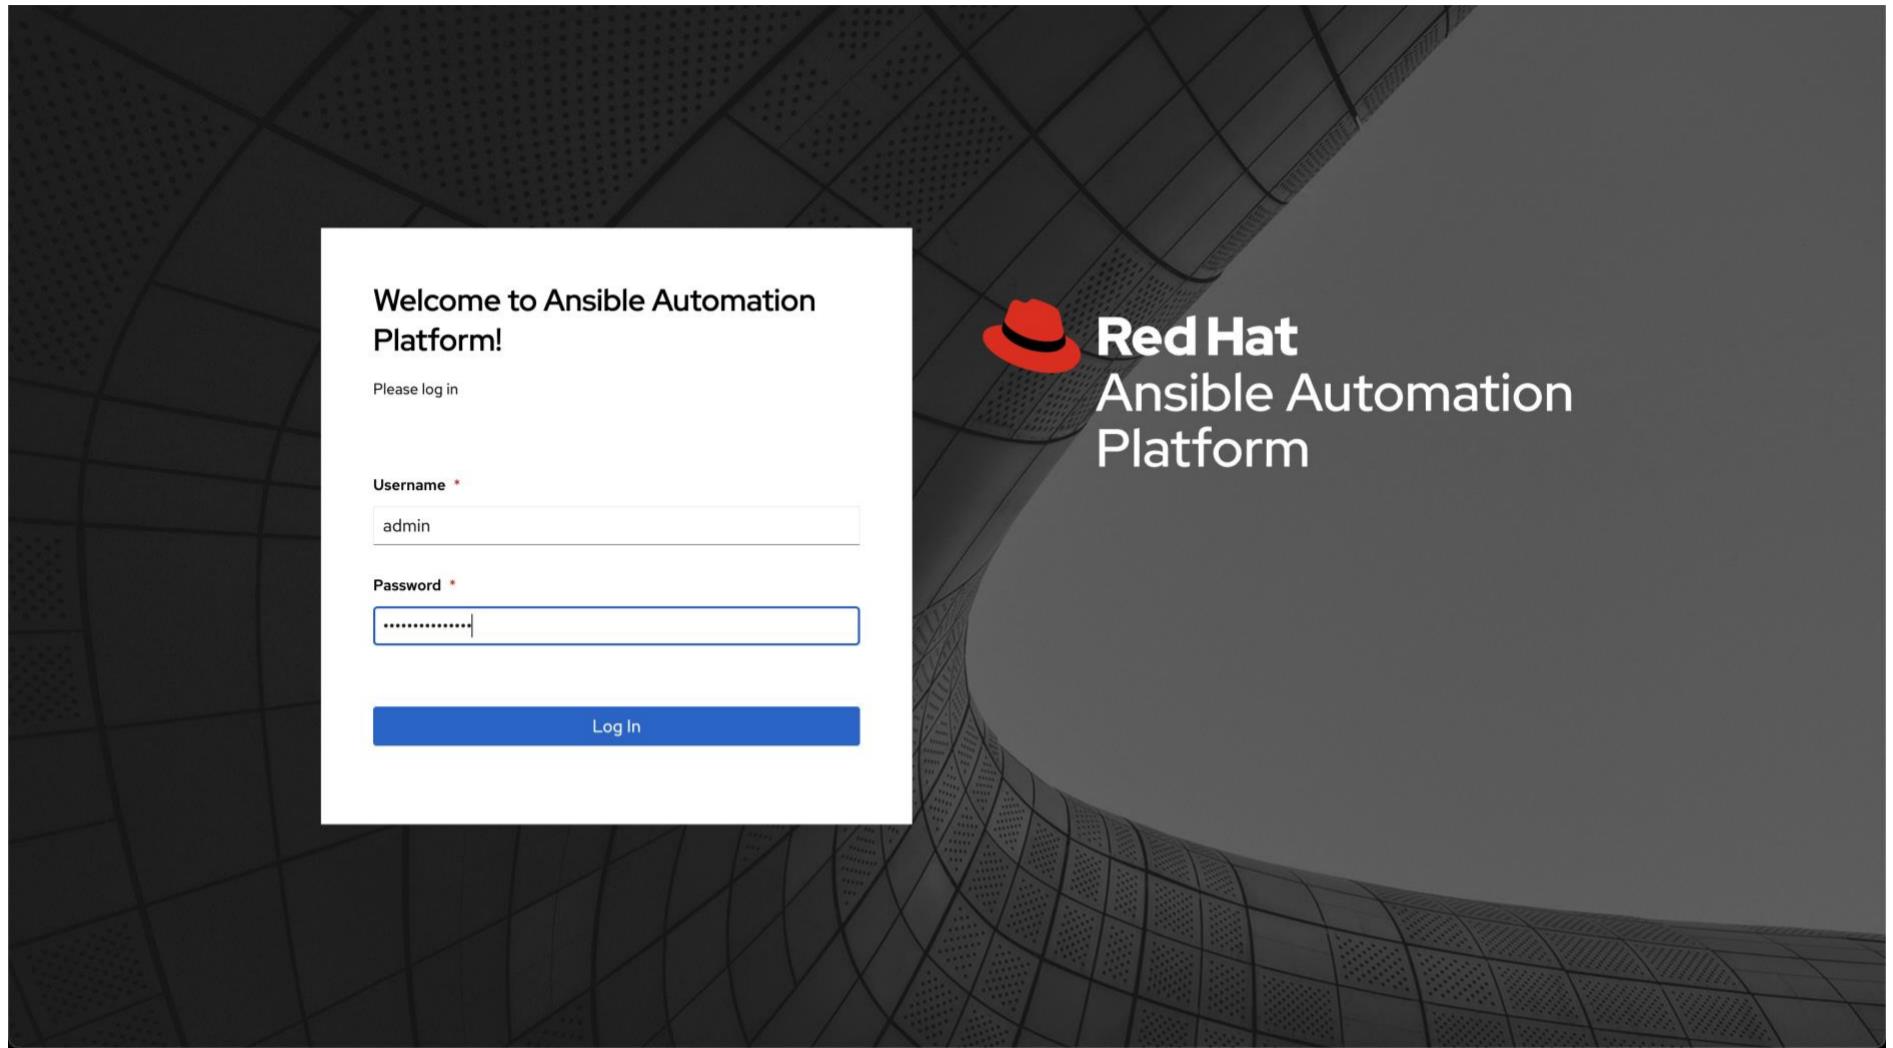

Go to power_aix_oracle collection and create ansible-navigator.yaml file

```
$ cat ansible-navigator.yaml
---
ansible-navigator:
  execution-environment:
    container-engine: podman
    enabled: True
    environment-variables:
      set:
        ANSIBLE_CONFIG: ansible.cfg
      image: oracle_si_dataguard_ee:latest

$ ansible-navigator run dataguard_playbook.yml --pp=missing -m stdout
```

11.3 Executing the Playbook from Ansible Controller AAP2 using execution environment via GUI

1. Login to the Ansible controller, provide the username and password.

2. To create a new execution environment, please click on the "Execution Environments" option under the Administration dropdown and click on Add

A screenshot of the Red Hat Ansible Automation Platform web interface. The left sidebar has sections for Resources (Templates, Credentials, Projects, Inventories, Hosts), Access (Organizations, Users, Teams), Administration (Credential Types, Notifications, Management Jobs, Instance Groups, Instances, Applications, Execution Environments, Topology View), and Settings. The "Execution Environments" section is currently selected. The main content area is titled "Execution Environments" and shows a table with five rows of data. The columns are "Name", "Image", "Organization", and "Actions".

Name	Image	Organization	Actions
Control Plane Execution Environment	registry.redhat.io/ansible-automation-platform-24/ee-supported-rhel8:latest	Globally Available	
Default execution environment	registry.redhat.io/ansible-automation-platform-24/ee-supported-rhel8:latest	Globally Available	
Minimal execution environment	registry.redhat.io/ansible-automation-platform-24/ee-minimal-rhel8:latest	Globally Available	
PODBA-EE	localhost/podba-ee	Default	
PODBA RAC Upgrade EE	localhost/oracle_rac_upgrade_ee	Default	

Please provide the following details to create a new execution environment:
Name: [Enter the name of the execution environment]
Image: [Specify the Docker image for the execution environment]
Pull Details: [Provide any additional details for pulling the image]
Once provided, click on "Save" to create the new execution environment.

The screenshot shows the Red Hat Ansible Automation Platform interface. On the left, there is a navigation sidebar with sections like Resources, Access, and Administration. Under Administration, the 'Execution Environments' option is selected. The main content area is titled 'Create new execution environment'. It contains fields for Name (with a red asterisk), Image (with a red asterisk), Pull (set to '-----'), Description, Organization (set to 'Default'), and Registry credential. A note below the organization field says 'Leave this field blank to make the execution environment globally available.' At the bottom are 'Save' and 'Cancel' buttons.

Once saved, we can see the following details to crosscheck.

This screenshot shows the same interface as the previous one, but with different values entered. The 'Name' field now contains 'PODBA Dataguard EE', the 'Image' field contains 'localhost/oracle_si_dataguard_ee', and the 'Pull' dropdown is set to 'Only pull the image if not present before running.' The other fields (Description, Organization, Registry credential) remain the same as in the first screenshot.

Once saved, the container image will be listed in Execution Environments

Name	Image	Organization	Actions
Control Plane Execution Environment	registry.redhat.io/ansible-automation-platform-24/ee-supported-rhel8:latest	Globally Available	
Default execution environment	registry.redhat.io/ansible-automation-platform-24/ee-supported-rhel8:latest	Globally Available	
Minimal execution environment	registry.redhat.io/ansible-automation-platform-24/ee-minimal-rhel8:latest	Globally Available	
oracle_rac_aix_ee	localhost/oracle_rac_aix_ee:latest	Globally Available	
PODBA Dataguard EE	localhost/oracle_si_dataguard_ee	Default	
PODBA-EE	localhost/podba	Globally Available	
PODBA RAC Upgrade EE	localhost/oracle_rac_upgrade_ee	Default	

3. To create Projects, click on the "Projects" option under the Resources dropdown and then click on the "Add" button to create Projects.

Name	Status	Type	Revision	Actions
PODBA	Successful	Git	f0a3e92	
PODBA RAC Upgrade	Successful	Git	8733536	

Please provide the following details:
Name: [Provide the name of your project]
Description: [Briefly describe your project]
Organization: [Select the organization for your project]
Execution Environment: [Select the corresponding execution environment created earlier]
Source Control Type: Git
Source Control URL: https://github.com/nav-a-dba/Upgrade_rac_DB [where the code is pushed]

Once provided the details, please click on “Save”

5. Create Two Hosts to support RAC for two nodes database

To create First hosts, click on the “Hosts” Option Under the resources dropdown and then click on the “Add” button to Create First Hosts

The screenshot shows the 'Hosts' list page in the Red Hat Ansible Automation Platform. The left sidebar has 'Hosts' selected under 'Resources'. The main area displays three hosts: 'orahostb' (Description: 'PODBA inventory'), 'p227n242.pbm.ihost.com' (Description: 'PODBA Upgrade inventory'), and 'p227n243.pbm.ihost.com' (Description: 'PODBA Upgrade inventory'). Each host has an 'On' toggle switch and edit/pencil icons.

Please provide the following information for the host 1:

Name: [Enter the name of the hostname of target machine, not with any name]

Description: [Enter a brief description of your project]

Inventory: [Select the inventory that was earlier created]

Variables: ansible-host: <IP Address>

After providing the required information, click on "Save".

The screenshot shows the 'Create New Host' dialog. The left sidebar has 'Hosts' selected under 'Resources'. The dialog form includes fields for 'Name' (with a red asterisk), 'Description', and 'Inventory' (with a search icon). Below these are 'Variables' sections for YAML and JSON, each containing a list with items 1 and 2. At the bottom are 'Save' and 'Cancel' buttons.

Once saved, we can see the following details to crosscheck.

The screenshot shows the 'Details' page for the host 'primary-db'. The host is active (Activity: 5 green, 1 red). It was created on 27/02/2025, 10:14:20 by admin and last modified on the same date. The host has an inventory entry for 'DG Setup'. Variables are listed as follows:

```
1 ---  
2 ansible_host: 129.40.76.243
```

Buttons for 'Edit' and 'Delete' are present at the bottom.

6. To create Second hosts, click on the “Hosts” Option Under the resources dropdown and then click on the “Add” button to Create Second Hosts

The screenshot shows the 'Hosts' list page. Three hosts are listed:

Name	Description	Inventory	Actions
orahostb		PODBA inventory	On Edit
p227n242.pbm.ihost.com	rac21	PODBA Upgrade inventory	On Edit
p227n243.pbm.ihost.com	rac22	PODBA Upgrade inventory	On Edit

Please provide the following information for the host 2:

Name: [Enter the name of the hostname of second target machine, not with any name]

Description: [Enter a brief description of your project]

Inventory: [Select the inventory that was earlier created]

Variables: ansible-host

After providing the required information, click on "Save".

The screenshot shows the 'Create New Host' page in the Red Hat Ansible Automation Platform. The left sidebar is dark-themed and includes sections for Views (Dashboard, Jobs, Schedules, Activity Stream, Workflow Approvals, Host Metrics), Resources (Templates, Credentials, Projects, Inventories, Hosts), Access (Organizations, Users, Teams), and Administration (Credential Types, Notifications). The 'Hosts' section under Resources is currently selected. The main content area has a light background and contains fields for 'Name *' (with placeholder 'host1'), 'Description', and 'Inventory *' (with a search icon). Below these are tabs for 'Variables' (YAML, JSON) and a code editor pane showing two lines of YAML: '1 ---' and '2 ansible_host: 129.40.76.242'. At the bottom are 'Save' and 'Cancel' buttons.

Once saved, we can see the following details to crosscheck.

The screenshot shows the 'Details' page for the host 'standby-db'. The left sidebar is identical to the previous screenshot. The main content area shows the host's status as 'On'. It lists the host's name as 'standby-db', its activity level (green), and its description as 'standby-db'. It also shows its inventory as 'DG Setup', created on 27/02/2025, 10:14:37 by 'admin', and last modified on the same date and time. The variables section shows the same YAML code as the creation screen. At the bottom are 'Edit' and 'Delete' buttons.

7. Now, to create Credentials, click on the "Credentials" option under the Resources dropdown and then click on the "Add" button to create Credentials

Name	Type	Actions
Ansible Galaxy	Ansible Galaxy/Automation Hub API Token	
oracle-cred	Machine	
oracle_rac_upgrade_cred	Machine	

Please provide the following information:

Name: [Enter the name of your credential]

Description: [Enter a brief description of your credential]

Organization: [Select the organization for your credential]

Credential Type: Machine

Username: [Enter the username for the machine]

Password: [Enter the password for the machine]

After providing the required information, click on "Save".

Once saved, we can see the following details to crosscheck.

Credentials > DG Setup

Details

Name: DG Setup
Description: oracle owner user
Credential Type: Machine
Username: oracle
Password: Encrypted
Last Modified: 21/03/2025, 16:08:03 by admin

Edit Delete

- Now, to create Templates, click on the "Templates" option under the Resources dropdown and then click on the "Add" button to create Templates.

```

10. If you want to execute only the precheck role, then along with the other details you add “job Tags”

Name: [Enter the name of your job]
 Description: [Enter a brief description of your job]
 Job Type: Run
 Inventory: [Select the inventory that was earlier created]
 Project: [Select the project that was earlier created]
 Execution Environment: [Select the execution environment that was earlier created]
 Playbook: [Enter the name of your playbook file]
 Variables: ansible_ssh_user: oracle
 Job Tags: dataguard_precheck
 After providing the required information, click on "Save".

The screenshot shows the Red Hat Ansible Automation Platform web interface. On the left, a sidebar navigation includes sections like Activity Stream, Workflow Approvals, Host Metrics, Resources (Templates selected), Credentials, Projects, Inventories, Hosts, Access (Organizations, Users, Teams), Administration (Credential Types, Notifications, Management Jobs, Instance Groups, Instances, Applications, Execution Environments, Topology View), and Settings. The main content area is titled 'Labels' and shows a 'Variables' tab with the following YAML code:

```

1- ##### This File contain all the Global Variables required to do the dataguard configuration for 19c database.
2 # Please update the variables by reading the comments provided at the
3 # beginning of each section.
4 # This variables file contain 4 sections:
5 #     A - Common Variables.

```

Below the variables, there are sections for 'Forks', 'Job Slicing', 'Instance Groups', and 'Job Tags'. The 'Job Tags' field contains 'dataguard_precheck'. The 'Options' section includes checkboxes for Privilege Escalation, Provisioning Callbacks, Enable Webhook, Concurrent Jobs, Enable Fact Storage, and Prevent Instance Group Fallback. At the bottom are 'Save' and 'Cancel' buttons.

If you want to execute only SYNC between primary and standby, then along with the other details you add “job Tags”

Note: podba_rac_crs_upgrade role have a dependency on podba_rac_upgrade_precheck role

Name: [Enter the name of your job]

Description: [Enter a brief description of your job]

Job Type: Run

Inventory: [Select the inventory that was earlier created]

Project: [Select the project that was earlier created]

Execution Environment: [Select the execution environment that was earlier created]

Playbook: [Enter the name of your playbook file]

Variables: ansible_ssh_user: oracle

Job Tags: dataguard_post_sync_check

After providing the required information, click on "Save".

The screenshot shows the Red Hat Ansible Automation Platform web interface. The sidebar and main layout are identical to the previous screenshot, but the 'Job Tags' field in the 'Job Tags' section now contains 'post_sync_check' instead of 'dataguard_precheck'. The rest of the configuration (Variables, Forks, Job Slicing, Options) remains the same.

12. Troubleshooting

If you see any failures during the playbook execution, to get more details regarding the failure try using -vvv option

```
$ ansible-playbook dataguard_playbook.yml --tags "preconfig" -vvv
```

You can create a github issue and our team will look into this

<https://github.com/IBM/ansible-power-aix-oracle-dba/issues>

13. Conclusion

This Ansible playbook automates Oracle Single Instance Data Guard setup, ensuring a seamless and repeatable deployment process. The setup enhances database resilience with minimal manual intervention.
